THRIFTKART / SEMESTER III

Risk Register & Closure Note

Exposure-ranked risks, RMMM and lessons learned

Risk lens	Probability × impact
Priority	Exposure-ranked top risks
Top controls	Scope freeze • front-load • moderation
Closure	Lessons learned + residual risk

1. Probability–Impact Matrix

Impact \ Probability	Low	Medium	High
Low	Low	Low	Medium
Medium	Low	Medium	High
High	Medium	High	Critical

2. Exposure-Ranked Risk Register

ID	Risk	Probability	Impact	Exposure	Primary response
R1	Exam-week capacity loss	High	High	Critical	Front-load critical path; keep weeks 9–10 at zero work.
R2	Scope creep	High	High	Critical	Freeze MVP; defer gateway, delivery, recommendations.
R3	Trust / fake listings	Medium	High	High	Mandatory moderation gate, reporting and audit trail.
R4	Inconsistent artefacts	Medium	High	High	Trace FRs to tests; synchronize UML/schema/SRS.
R5	Payment complexity	Medium	Medium	Medium	Use payment status/confirmation instead of full gateway.

3. RMMM for Top Three

Risk	Reduce	Monitor / trigger	Mitigate	Residual
R1	Risk reduction	Baseline plan before exam weeks; monitor weekly critical-path slippage.	If capacity drops, protect the critical path and defer non-critical enhancements.	Residual: Low after scope freeze and front-loading.
R2	Risk reduction	Use MoSCoW gate; no new Must items without mentor approval.	Remove/park Could features and preserve core sale path.	Residual: Medium.
R3	Risk reduction	Require moderation before publish; retain decision evidence; expose report queue.	Temporarily hide suspect listing/user and review manually.	Residual: Medium.

4. Closure Note

The project should be considered closed only when the MVP workflow is demonstrated, the quantitative estimates and actual outcomes are recorded, the test evidence is complete, critical defects are resolved, the final risks have owners, and the BRD/SRS/UML/test artefacts remain internally consistent.

5. Lessons Learned

- Scope decisions made before coding reduce rework when team capacity is limited.
- A shared requirement ID scheme makes SRS, tests and UML easier to reconcile.
- A deliberately simple payment model preserves the business outcome while reducing technical coupling.
- Moderation is a product control, not merely an admin screen; it must appear in requirements, data, workflow and tests.
